Abstract: This paper describes the structured custom design of a pipelined floating point unit (FPU) macrocell. The core of the floating point unit is a multiplier-accumulator (MAC) block which can execute a 2 clock cycle addition, subtraction or multiplication, or, a 4 cycle multiply-accumulate operation. The floating point unit supports both floating point and signed integer arithmetic, as well as float-to-int, int-to-float, and float-to-float conversions between different mantissa widths. The simulated cycle time for the FPU with typical process parameters at 3.3 V and 85 degrees C is 5.2 ns. The rapid completion of the design was made possible by the use of an existing generator based datapath module library. Approximately 25 man months were required from initial customer specification until final physical assembly of the structured custom block. The floating point unit is implemented with 165,000 transistors in a 0.35 mu m, 4 metal CMOS process and occupies 2.45 mm\*2.55 mm.

Abstract: This paper describes the use of a datapath library in the design of a high performance, pipelined floating point unit (FPU) macrocell. The existence of the intellectual property (IP) library allowed the rapid completion of the FPU within the context of a high performance structured custom design flow. The 165000 transistor floating point unit was completed in 25 man months from initial customer specification to final physical assembly. The macrocell occupies 2.45 mm\*2.55 mm in a 0.35 mu m, 4 metal CMOS process and has a simulated cycle time of 5.2 ns at 3.3 V and 85 degrees C.

Abstract: This paper introduces novel transistor reordering schemes to reduce the expected or average dynamic power dissipation in CMOS circuits. The transistor reordering is based on the signal probability values at the inputs of the gates. The paper begins with a simple analytical model for the dynamic power dissipation in a static NAND gate. The model is used to derive an algorithm for transistor reordering which reduces dynamic power dissipation. A simulation technique for accurately measuring the power dissipation in NAND gates is also presented, along with the results of the reordering algorithm. A transistor reordering algorithm for CMOS complex gates is subsequently presented. Transistor reordering is found to be an effective way to reduce power dissipation in all of these circuits, with the reduction in dynamic power dissipation compared to the worst case configuration, being as high as 50% in some instances. The limited overhead associated with transistor reordering encourage its application as a low power design technique.

Abstract: We propose a new frequency hop code, called the extended hyperbolic congruential (EHC) code. The properties of the code, determined via hit array analysis, indicate almost ideal cross- and auto-ambiguity characteristics. Furthermore, the code can be defined recursively, enabling a simple hardware implementation. This makes the code attractive for code division multiple access (CDMA) communication systems.

Abstract: A new set of double edge triggered flip-flops has been developed. It requires fewer transistors to implement than earlier designs. The energy consumption in the authors' double edge triggered flip-flops is shown to be lower than in single edge triggered (SET) flip-flops. This is demonstrated by architecture level analysis, circuit analysis and simulation techniques. The maximum data rate in double and single edge triggered flip-flops is also compared via simulation.

Abstract: Frequency hop codes represent a class of codes in which the signal is transmitted as a sine wave, whose frequency at any time, is one of a set of possible discrete values. A 2.0-  $\mu$  m CMOS technology transmitter which efficiently generates the signal for an extended hyperbolic congruential (EHC) frequency hop code is described. Minimal hardware is used to generate the constituent sine waves and the placement operator (the function which defines the sequence in which the sine waves are transmitted). The constituent sine waves are generated by characterizing them as phase increments, while the placement operator is evaluated by defining it as a recursive function.

Abstract: In this paper we show how transistor reordering based on input signal probabilities can substantially reduce the expected dynamic power dissipation in serially connected MOSFETs. The paper includes a new model for the power dissipation in a MOSFET chain and extensive simulation results. Our results indicate that transistor reordering can significantly reduce the power dissipation in CMOS NAND gates.

**Abstract:** In this paper we study the power savings possible using double edge triggered (DET), instead of, conventional single edge triggered (SET) flip-flops. We begin the paper by introducing a set of novel D-type double edge triggered flip-flops which can be implemented with fewer transistors than any previous design. The power dissipation in these flip-flops and single edge triggered flip-flops is compared via architectural level studies, analytical considerations and simulations. The analysis includes an implementation independent study on the effect of input sequences in the energy dissipation of single and double edge triggered flip-flops. The system level energy savings possible by using registers consisting of double edge triggered flip-flops, instead of single edge triggered flip-flops, is subsequently explored. The results are extremely encouraging, indicating that double edge triggered flip-flops are capable of significant energy savings, for only a small overhead in complexity.

**Abstract:** Frequency hop codes represent a class of codes in which the signal is transmitted as a sine wave whose frequency, at any time, is one of a set of possible discrete values. This paper describes a new method for the efficient generation of a family of hop code signals, defined upon extended hyperbolic congruences, enabling them to be of practical importance. The extended hyperbolic congruential (EHC) coding scheme is implemented with minimal hardware by optimizing the two processes needed in the synthesis of the code words, i.e., generation of the constituent sine waves, and evaluation of the sequence in which they follow each other-which is defined by a function called the placement operator. The constituent sine waves are generated by characterizing them as phase increments. This enables a simplified hardware implementation with an adder and an accumulator. Since all frequency hop codes require a set of sine waves, this method can be utilized in other frequency-hopping schemes. The placement operator is calculated by showing that module addition can replace the module multiplication required in the process. This result can also be applied to conventional hyperbolic congruential codes. These design innovations significantly reduce the complexity of the design and are illustrated in a VLSI extended hyperbolic congruential hop code transmitter implemented in 2.0  $\mu$ m CMOS technology.

2000 1 REFS.

The purpose of this paper is to describe an experimental procedure for verifying the navigation data provided by the NASA Goddard Space Flight Center's Tropical Rainfall Measurement Mission (TRMM) Precipitation Radar (PR). The TRMM PR is a satellite-borne, electronically scanning, range-gated radar that produces 3D images of the structure of atmospheric precipitation. Due to the dynamic nature of precipitation events in space and time, proper collocation is critical to the accuracy of the data. (Author)

Abstract: While double edge triggered (DET) flip-flops have been advocated for their low energy consumption and high throughput, the utilization of these structures has been restricted by the high complexity overhead associated with them. We have, however, developed a new set of double edge triggered flip-flops which require fewer transistors to implement than earlier designs. The energy consumption in our double edge triggered flip-flops is shown to be lower than in single edge triggered (SET) flip-flops. This is demonstrated by architecture level analysis, circuit analysis and simulation techniques. The maximum data rate in double and single edge triggered flip-flops is also compared via simulation.

PAGE 2782. 116 PAGES

In recent years the power dissipation of VLSI circuits has emerged as a critical design criterion. This thesis explores the use of reduced switching activity--the average rate at which the nodes of a circuit change their logic state--to design low power CMOS circuits.

The thesis begins with a systematic analysis of the switching activity in combinational logic circuits. The switching activity in two-level and multilevel combinational implementations is formally studied, and algorithms to synthesize reduced switching activity circuits presented.

Subsequently, techniques to reduce the power dissipation in combinational circuits having a number of highly switching inputs are provided. Reduced switching activity in the clocking circuitry is explored by the use of double edge triggered flip-flops. The thesis demonstrates the power savings possible via double edge triggered flip-flops. At the circuit level, signal probability based transistor reordering is advocated for reduced switching activity. Low power transistor reordering algorithms for serially connected MOSFET chains and complex gates are presented.

Simulations are extensively employed in the thesis to validate the proposed techniques. The results of this thesis clearly demonstrate the applicability of reduced switching activity in low power VLSI design.

**Activation of human vascular endothelial cells by factor Xa : Effect of specific inhibitors**

HERAULT J P; BONO F; AVRIL C; SCHAEFFER P; HERBERT J M

Haemobiology Research Department, Sanofi Recherche, 31036 Toulouse, France

Journal: Biochemical pharmacology, 1999, 57 (6) 603-610

Language: English

Recently, human umbilical vein endothelial cells (HUVEC) have been shown to express functional high-affinity receptors for factor Xa, which may be of importance in the regulation of coagulation and homeostasis of the vascular wall. In this paper, we demonstrate that when added to cultured HUVEC, factor Xa was a potent mitogen, stimulating an increase in cell number at a 0.3 to 100 nM concentration. The same doses of factor Xa also increased intracellular free calcium levels and phosphoinositide turnover. When added to confluent HUVEC, factor Xa induced the expression of tissue factor and the release of tissue-type plasminogen activator and plasminogen activator inhibitor- without affecting urokinase expression. Indirect (antithrombin-pentasaccharide) and direct (DX9065) inhibitors of factor Xa affected all these activities of factor Xa in a dose-dependent manner. Taken together, these data show that the activities induced by factor Xa on HUVEC were dependent on its catalytic activity and could be inhibited by both direct and indirect factor Xa inhibitors.

Journal: Nature : (London), 1998, 394 (6692) 485-490

Language: English

As a result of deprivation of oxygen (hypoxia) and nutrients, the growth and viability of cells is reduced SUP 1 . Hypoxia-inducible factor (HIF)-1 alpha helps to restore oxygen homeostasis by inducing glycolysis, erythropoiesis and angiogenesis SUP 2 SUP - SUP 4 . Here we show that hypoxia and hypoglycaemia reduce proliferation and increase apoptosis in wild-type (HIF-1 alpha SUP + SUP / SUP + ) embryonic stem (ES) cells, but not in ES cells with inactivated HIF-1 alpha genes (HIF-1 alpha SUP - SUP / SUP - ); however, a deficiency of HIF-1 alpha does not affect apoptosis induced by cytokines. We find that hypoxia/hypoglycaemia-regulated genes involved in controlling the cell cycle are either HIF-1 alpha -dependent (those encoding the proteins p53, p21, Bcl-2) or HIF-1 alpha -independent (p27, GADD153), suggesting that there are at least two different adaptive responses to being deprived of oxygen and nutrients. Loss of HIF-1 alpha

reduces hypoxia-induced expression of vascular endothelial growth factor, prevents formation of large vessels in ES-derived tumours, and impairs vascular function, resulting in hypoxic microenvironments within the tumour mass. However, growth of HIF-1 alpha tumours was not retarded but was accelerated, owing to decreased hypoxia-induced apoptosis and increased stress-induced proliferation. As hypoxic stress contributes to many (patho)biological disorders SUP 1 SUP , SUP 5 , this new role for HIF-1 alpha in hypoxic control of cell growth and death may be of general pathophysiological importance.

**The inhibitory effect of heparin for vascular smooth muscle cell proliferation or migration is not mediated by U-PA and T-PA**

HERBERT J M ; BONO F; LAMARCHE I; CARMELIET P

Haemobiology Research Department, Sanofi Recherche, Toulouse, France;  
Center for Transgene Technology and Gene Therapy, K.U., Leuven, Belgium

Journal: Thrombosis research, 1997, 86 (4) 317-324

Language: English

Previous works suggest the interesting possibility of an effect of heparin on vascular smooth muscle cell (SMC) replication and migration via a selective inhibition of the expression of t-PA and u-PA both of which may play major roles during intimal hyperplasia following endothelial injury. The present study was undertaken to evaluate in vitro the effect of heparin on the growth and migration of aortic SMC isolated from transgenic mice showing single inactivations of the t-PA and u-PA genes comparatively to SMC isolated from control mice. With regard to serum-induced proliferation and migration, all cell types showed similar responses. On control cells, heparin inhibited in a dose-dependent manner the expression of both t-PA and u-PA protein and mRNA. Heparin however, similarly affected the mitogenic and chemotactic activity of FCS for SMC isolated from control, t-PA or u-PA-deficient mice therefore showing that heparin inhibits FCS-induced SMC proliferation via mechanism(s) other than single inhibition of t-PA or u-PA expression by smooth muscle cells.

**Failure of heparin to inhibit the expression of the thrombin receptor following endothelial injury of the rabbit carotid artery**

GUITTENY A F; HERBERT J M

Haematology Research Department, Sanofi Recherche, 195 Route d'Espagne, 31036 Toulouse, France

Journal: European journal of pharmacology, 1997, 327 (2-3) 157-162

Language: English

The effect of heparin on thrombin receptor expression was evaluated in an experimental model of myointimal smooth muscle cell proliferation in rabbits. Myointimal hyperplasia was induced by an air-drying injury of the carotid artery and thrombin receptor expression following endothelial injury was measured by in situ hybridisation and immunohistochemistry. In healthy arteries, thrombin receptor mRNA and protein were detected in the endothelial cells only. In contrast, 14 days after endothelial injury, thrombin receptor mRNA expression increased in the smooth muscle cells present in the neointima, predominantly in areas of active cell proliferation. A 2-week subcutaneous treatment with heparin (10 mg/kg per day, s.c.) inhibited smooth muscle cell hyperplasia occurring in the intima following deendothelialization (80 + 7.8% inhibition, P < 0.001). The 14-day heparin treatment strongly reduced thrombin receptor gene and

protein expression observed in the endothelial cells in healthy arteries but did not affect thrombin receptor expression which occurred in smooth muscle cells which have proliferated in the neointima as a consequence of endothelial injury. These results therefore establish that thrombin receptor expression during intimal hyperplasia is an heparin-insensitive event.

**Nonproteolytic activation of the thrombin receptor promotes human umbilical vein endothelial cell growth but not intracellular Ca SUP 2 SUP + , prostacyclin, or permeability**

SCHAEFFER P; RIERA E; DUPUY E; HERBERT J M

Haemobiology Research Department, Sanofi Recherche, 195 Route d'Espagne, 31036 Toulouse, France; INSERM U348, Paris, France

Journal: Biochemical pharmacology, 1997, 53 (4) 487-491

Language: English

Both thrombin and the synthetic tetrapeptide thrombin receptor-activating peptide (TRAP), recently described as a peptide mimicking the new amino terminus created by cleavage of the thrombin receptor, stimulated the proliferation of human umbilical vein endothelial cells (HUVEC) in culture. Although to a lesser extent, F-14, a tetradecapeptide representing the residues 365-378 of human prothrombin, also promoted HUVEC growth, thereby demonstrating that thrombin can stimulate HUVEC growth via both a proteolytic and a nonenzymatic pathway. Thrombin-TRAP-, and F-14-induced HUVEC growth were inhibited by a thrombin receptor oligodeoxynucleotide antisense, showing that the growth-inducing effects of all 3 compounds were mediated through the same thrombin receptor. Thrombin and TRAP also stimulated intracellular Ca SUP 2 SUP + increase, monolayer permeability increase, and prostacyclin release in HUVEC. None of these effects was observed with F-14, suggesting that thrombin-induced intracellular Ca SUP 2 SUP + release, permeability increase, and prostacyclin release in HUVEC required catalytic cleavage of the receptor, whereas thrombin-induced growth might also be due to activation of the thrombin receptor through a nonproteolytic pathway.

**Effect of SR 33805 on arterial smooth muscle cell proliferation and neointima formation following vascular injury**

DOL F; SCHAEFFER P; LAMARCHE I; MARES A M; CHATELAIN P; HERBERT J M  
Sanofi Recherche, haemobiology res. dep., 31036 Toulouse, France  
Journal: European journal of pharmacology, 1995, 280 (2) 135-142  
Language: English

The possible activity of SR 33805 ((N-(dimethoxy-3,4-phenethyl)-N-methyl amino-propoxyl)-4-benzenesulfonyl)-2-isopropyl-3-methyl-1-indole), a novel Ca SUP 2 SUP + channel blocker, in early atherogenesis was investigated. In vitro, SR 33805 strongly inhibited fetal calf serum-induced proliferation of cultured human aortic smooth muscle cells with an IC SUB 5 SUB 0 value of  $0.3 \pm 0.1 \mu\text{M}$  ( $n = 3$ ). In this respect, SR 33805 was several fold more active than the reference compounds : diltiazem, verapamil, nifedipine and fantofarone. SR 33805 was also a potent inhibitor of platelet-derived growth factor- or basic fibroblast growth factor-induced proliferation of human smooth muscle cells. SR33805 inhibited serum-stimulated SUP 4 SUP 5 Ca SUP 2 SUP + uptake in these cells, with an IC SUB 5 SUB 0 value of  $47 \pm 18 \text{ nM}$ . The effect of SR 33805 on intimal smooth muscle hyperplasia in rabbit carotid arteries subjected to air-drying endothelial injury was then investigated. After a 16-day treatment, SR 33805 (6.0 mg/kg/day p.o.) inhibited the development of intimal thickening. Under the same experimental conditions, nifedipine, verapamil, diltiazem (2 x 6 mg/kg/day p.o. - 16 days) and fantofarone (12 mg/kg/day p.o. - 16 days) were inactive. These results show that SR 33805, a novel and potent Ca SUP 2 SUP + channel blocker, can reduce myointimal thickening following endothelial injury.

Journal: American journal of physiology. Heart and circulatory physiology  
, 1995, 37 (1) H404-H410  
Language: English

The effects of SR-49059, a new nonpeptide and selective arginine vasopressin (AVP) V SUB 1 SUB a antagonist, were investigated in binding and functional studies on cultured human aortic vascular smooth muscle cells (VSMC). Characterization of human vascular V SUB 1 SUB a receptors, using a specific V SUB 1 SUB a radioiodinated ligand, showed that ( SUP 1 SUP 2 SUP 5 I)-linear AVP antagonist binding to human VSMC membranes was time dependent, reversible, and saturable. A single population of high-affinity binding sites (apparent equilibrium dissociation constant =  $15 \pm 6 \text{ pM}$ ; maximum binding density =  $36 \pm 5 \text{ fmol/mg protein}$ , i.e., similar 3,000 sites/cell) with the expected V SUB 1 SUB a profile was identified. Exposure of these cells to AVP dose-dependently produced cytosolic free (Ca SUP 2 SUP + ) increase (AVP concentration required to obtain a half-maximal response (EC SUB 5 SUB 0 ) =  $23 \pm 9 \text{ nM}$ ) and proliferation (EC SUB 5 SUB 0 =  $3.2 \pm 0.5 \text{ nM}$ ). SR-49059 strongly and stereospecifically inhibited ( SUP 1 SUP 2 SUP 5 I)-linear AVP antagonist binding to VSMC V SUB 1 SUB a receptors (inhibition constant (K SUB i ) =  $1.4 \pm 0.3 \text{ nM}$ ), AVP-evoked Ca SUP 2 SUP + increase (concentration of inhibitor required to obtain 50% inhibition of specific binding (IC SUB 5 SUB 0 ) =  $0.41 \pm 0.06 \text{ nM}$ ), and the mitogenic effects induced by 100 nM AVP (IC SUB 5 SUB 0 =  $0.83 \pm 0.04 \text{ nM}$ ). OPC-21268, another nonpeptide V SUB 1 SUB a antagonist, was more than two orders of magnitude less potent than SR-49059 in these models. However, the consistent affinity (K SUB i =  $138 \pm 21 \text{ nM}$ ) and activity found with OPC-21268 on human VSMC in comparison with the inactivity already observed for other human V SUB 1 SUB a receptors (liver, platelets, adrenals, and uterus) strongly suggested the existence of human AVP V SUB 1 SUB a -receptor subtypes. In conclusion, SR-49059 displays high affinity for human vascular V SUB 1 SUB a receptors and high potency in inhibiting the AVP physiol

Sanofi Recherche, hemobiology res. dep., 31036 Toulouse, France

Journal: The Journal of biological chemistry, 1994, 269 (4) 3076-3080

Language: English

Tissue-type plasminogen activator (t-PA) is a potent and efficacious mitogen for growth-arrested cultured human aortic smooth muscle cells, stimulating an increase in cell number at 0.3-30 nM concentration. Double-chain t-PA is as efficient as single-chain t-PA in stimulating smooth muscle cell mitogenesis, whereas single-chain urokinase-type plasminogen activator (u-PA) or u-PA and plasmin or plasminogen are ineffective. Plasminogen activator inhibitor-1, Pefabloc-TPA, diisopropyl fluorophosphate or alpha 1-anti-trypsin inhibit the mitogenic effect of t-PA for smooth muscle cells in a dose-dependent manner, showing that it is dependent on the enzymatic activity

Proliferation of smooth muscle cells within the intima plays a key role in vascular occlusive disorders such as atherosclerosis and restenosis following balloon angioplasty. Among the factors that may be important in the development of vascular lesions, several authors have reported that the local angiotensin system participates in modulating the proliferation of smooth muscle cells after arterial injury. This study was therefore designed to characterize the antagonistic properties and to investigate the antiproliferative effect of a newly developed non-peptide angiotensin II AT SUB 1 receptor antagonist, SR 47436. This compound is a potent and competitive antagonist of the binding of ( SUP 1 SUP 2 SUP 5 I)angiotensin II to its receptor on cultured human aortic smooth muscle cells, exhibiting an IC SUB 5 SUB 0 value of 1.7 +- 0.6 nM

The possible activity of ticlopidine and its analogue clopidogrel in early atherogenesis was investigated. Incubation of rabbit platelets with the extracellular matrix produced by endothelial cells in culture induced massive platelet adherence in vitro. This phenomenon was strongly reduced when platelets were isolated from rabbits that had been treated with a single dose of clopidogrel (10 mg/kg PO) or three doses of ticlopidine (each 200 mg/kg PO) (94% and 56% inhibition of platelet adhesion, respectively). Three doses of aspirin (each 200 mg/kg PO) were ineffective. Air-drying injury of the rabbit carotid artery resulted in platelet adherence to the underlying subendothelium

**Involvement of protein kinase C in the mitogenic and chemotaxis effects of basic fibroblast growth factor on bovine cerebral cortex capillary**

**endothelial cells**

DAVIET I; **HERBERT J M** ; MAFFRAND J P  
Sanofi rech., Toulouse 31036, France  
Journal: FEBS letters, 1990, 259 (2) 315-317  
Language: English

Basic fibroblast growth factor is increasingly implicated in cellular growth, differentiation, angiogenesis and oncogenesis. In culture, basic fibroblast growth factor greatly improved the growth rate of bovine brain cortex capillary endothelial cells. Down-regulation of protein kinase C by prolonged treatment with phorbol esters prevented the mitogenic effect of basic fibroblast growth factor on capillary endothelial cells. furthermore, staurosporine, a potent protein kinase inhibitor, showed strong antiproliferative activity against basic fibroblast growth factor-induced endothelial cell growth. similarly, the chemotaxis effect of basic fibroblast growth factor on capillary endothelial cells was abolished by down-regulation of protein kinase c or by staurosporine treatment. Therefore, it is suggested that protein kinase C could account for part of the angiogenic effect of basic fibroblast growth factor

Designated States (National): JP KR US

JP 11543432 X H04L-012/28 Based on patent WO 9944337

Abstract (Basic): WO 9944337 A1

Abstract (Basic):

NOVELTY - The control apparatus involves a control node which decides (S82,S83) whether a node is properly controlled by a signal from the control node, e.g., by a signal that permits originating a call. The control node measures (S84) the duration in which the node has not been properly controlled.

DETAILED DESCRIPTION - The control node forcibly removes the ID of the node (S96) if the duration exceeds a preset value i.e. monitor count. After a preset period of time, the removed ID can be assigned to a new node that enters the network.

INDEPENDENT CLAIMS are included for a control method, a method and an apparatus for **information processing**, a **communication** system, and a **computer-readable** medium for use with the controller.

USE - For use in a wireless network.

ADVANTAGE - Nodes communicating poorly are removed from the network to improve **communication** efficiency.

DESCRIPTION OF DRAWING(S) - The drawing shows a flow diagram to illustrate the control method.

Abstract (Basic): WO 9938291 A1

Abstract (Basic):

NOVELTY - A bridge manager is automatically determined. In a network, bridges (51-54) are formed by coupling portals (41-48) connected to buses (11-15) so that different buses are connected together through the bridges. The portals have registers that store the IDs, and the values indicative of the function, of the bridge managers corresponding to the respective portals. One bridge manager is selected from candidates (31,34) according to the contents in the registers.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for a method and apparatus for **information processing**, and a **computer-readable** media, involving the network configuration method.

USE - For a network.

DESCRIPTION OF DRAWING(S) - The drawing shows a diagram to illustrate the network configuration method.

Abstract (Basic): WO 9938290 A1

Abstract (Basic):

NOVELTY - The control method involves a control node (2) which holds a preset number of node IDs i.e. bus IDs with consideration for potential subscriber nodes (3-6) to be controlled. When a new node to be controlled enters the network, the control node provides an unused node ID for the new node. When a node leaves the network, on the other hand, the control node frees its ID as an unused one.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for a control apparatus, a wireless **communication** system, and 'computer-retrievable media'.

USE - For a wireless **communication** system (claimed), such as an IR LAN linking AV equipment, a computer, etc.

ADVANTAGE - When a substation node enters or leaves the network, the control node can easily keep the overall network operation under control, resulting in the elimination of the need for reconfiguration.

DESCRIPTION OF DRAWING(S) - The drawing shows a diagram to illustrate the control method.

Abstract (Basic): WO 9917500 A1

Abstract (Basic):

NOVELTY - The radio **communication** device includes one control node and one or more controlled nodes controlled by the control node. The control node transmits a control block at the start of every 125musec cycle. The controlled node refers to the control block and synchronizes its own transfer clock signal with the transfer clock signal of the control node which controls the transmission from each node. Consecutive cycles each include time slots, of which a preset one is used to transfer a fixed length data block among the nodes.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is included for a radio **communication** method.

USE - For transferring data among nodes in a wireless network.

ADVANTAGE - The instantaneous switching of the transmitting node is ensured and wireless data transfer on a high-speed serial bus is realized.

DESCRIPTION OF DRAWING(S) - The drawing shows a diagram to illustrate the radio **communication** method.

US 5537165	A		9 G03B-031/02	

Abstract (Basic): US 5537165 A

The audio reproduction apparatus includes CCD line sensors (10L and 10R) for reproducing left and right audio channels. Each channel has an error detector communicating with the CCD line sensors for detecting errors in the left and the right channels.

Two processor communicate with the processor, in **communication** with the CCD channels generate right channel audio data from the reproduced left channel audio data, and generate left channel audio data from the reproduced right channel audio data. Two error correction circuits (14L and 14R), in **communication** with the CCD line sensors and the error detectors, substitute the generated channels for the reproduced channels in response to a detected error in a reproduced channel audio data.

USE/ADVANTAGE - Provides motion picture film in which high quality audio signals may be positively reproduced by digital signal processing techniques. Reproduces sound field rich in ambience. Reliable. Positively reproduces the audio data of plural channels. Provides error correction.

ABSTRACT EP 688113 A2

An encoding method and apparatus for encoding multi-channel signals employed in, for example, a stereo system of a video disc player, a video tape recorder, a motion picture film picture system, or a so-called multi-surround acoustic system. Five channels, namely the center (C) channel, left (L) channel, right (R) channel, left surround (SL) channel and the right surround (SR) channel, for example, are handled in common depending upon frequency characteristics of digital audio signals and the

targeted playback environment, and encoding (105) is done while the combinations of the channels to be handled in common are altered. High compression may be achieved with the use of pre-existing encoding and decoding units by handling the channels in common without dependency upon the degree of correlation of multi-channel digital data. (see image in original document)

FILED: November 09, 1998 (19981109)

#### ABSTRACT

PROBLEM TO BE SOLVED: To allow a **communication** device whose band capacity is less than 100 Mbps to be regarded as an IEEE1394 **communication** device.

SOLUTION: Buses 21, 31 are connected via a bridge 40. The bridge 40 consists of portals 40A, 40B and the portals 40A, 40B are communicated by an infrared ray. RAMs 43A, 43B have a bandwidth available register to which an available residual band capacity for synchronization **communication** in the bridge 40 is written. ROMs 44A, 44B store respectively a band capacity available for synchronization **communication** by infrared ray **communication** sections 45A, 45B as an initial value BWR. In the case of initializing the bridge 40, the initial value BWR is written in the bandwidth available register. Thus, even when the band capacity between the infrared ray **communication** sections 45A, 45B is less than 100 Mbps, the bridge 40 can be operated by regarding it as **communication** equipment whose band capacity is 100 Mbps.

ABSTRACT

PROBLEM TO BE SOLVED: To realize one-to-multi **communication** , when conducting **communication** among portal nodes configuring a bridge interconnecting IEEE1394 bus.

SOLUTION: This processor is provided with a photodiode 170, that receives a light signal resulting from converting a signal in compliance with the IEEE1394 standards from two nodes or more into infrared-ray **communication** light, a demodulation/descrambling section 172 that demodulates a light receiving signal, a header extract section 174 that extracts a header added to the light receiving signal from the demodulation/descrambling section 172, a data decoding section 176, that decodes a signal in compliance with the IEEE1394 standards based on header information and a switch section 180, that selectively outputs the signal in compliance with the IEEE1394 standards to be decoded based on the header.

ABSTRACT

PROBLEM TO BE SOLVED: To prevent a band capacity, a channel number and a stream number from being left unopened by opening the band capacity, reservation of the channel number and setting of the stream number used by devices other than those of an owner in an IEEE 1394 bridge.

SOLUTION: In a network where ridges are configured by nodes (portal) connecting to an IEEE1394 bus, information of a **communication** resource of a node (owner) 3 that manages a **communication** resource (and capacity, channel number, stream number) reserved by synchronization **communication** in excess of each bridge is stored in a RAM of a node (portal) 8, for example, and when there is no node (owner) 3 anymore in the network, the node (portal) 8 opens a **communication** resource reserved in advance based on information of the **communication** resource stored in the RAM. The opening processing of the **communication** resource is sequentially propagated after a node (portal) 9.

ABSTRACT

PROBLEM TO BE SOLVED: To adaptively control the transfer width of a controlled node by adding identifiers for identifying outer nodes to the respective controlled nodes, transmitting transmission information to a control node immediately before transmission data and deciding the transfer width of transmission data based on transmission information.

SOLUTION: Transmission information on the quantity of data to be transmitted is sent to a control node-side prior to data to be transmitted. The transmission information part of the node A is installed in a synchronous block Ca added to the node A apart from a transfer clock signal and node ID. In the control node-side, transmission information of the transmission information part is decoded and transfer widths Wa and Wb which are to be allocated to the node are decided. For constituting transmission information by adding an ECC code, error correction processing time Wx based on the ECC code is considered and the transmission timing of the node A and a node B are set.

ABSTRACT

PROBLEM TO BE SOLVED: To simplify control of transmission permission for each node by switching to a lower data transfer speed and using it if a **communication** device is compatible with a higher data transfer speed.

SOLUTION: When different data transfer speeds coexist, for example, controlled nodes 2 and 3 of 50 Mbps and a controlled node 4 of 25 Mbps coexist, data transmission from the controlled nodes 2(3) to a control node 1 is performed at 50 Mbps, the highest data transfer speed, out of the data transfer speeds common to be nodes 1 to 3. Since the highest data transfer speed of the controlled node 4 is 25 Mbps, the data transfer speed for data transmission from the controlled node 4 to the control node 1 is selected to be the highest speed of 25 Mbps common to the nodes 1 and 4. For instance, in the case of a battery operation, the transfer speed of data to be transmitted is changed to the slow speed, in this case, to the lowest data transfer speed that the controlled node has.

ABSTRACT

PROBLEM TO BE SOLVED: To prevent the occurrence of synchronous **communication** disabled conditions between IEEE-1394 buses when the buses are connected to each other through a bridge.

SOLUTION: When supplying a synchronizing signal to a node 4 from a node 3 through an IEEE-1394 bus 1 and transferring the synchronizing signal to another IEEE-1394 bus 2 from the node 4 through a node 5, the node 5 must be a cycle master which can output the synchronizing signal to the bus 2 to which the node 5 belongs. When the bus 2 is reset, a set packet is inserted into the bus 2 so that the node 5 itself may be the cycle master of the bus 2, because it is not guaranteed that the node 5 again becomes the cycle master.

ABSTRACT

PROBLEM TO BE SOLVED: To prevent break of a frequency band capacity and contention of stream numbers.

SOLUTION: A node 5 that is a portal of a bridge and a management node stores to its RAM 53 a band capacity and stream information usable for synchronized **communications**. In the case of conducting synchronized **communication** between a node 3 connecting with an IEEE 1394 bus 1 and a node 6 connecting with an IEEE 1394 bus 2, a node 3 reserves a band capacity and a stream number to be used, corresponding to the available band capacity and the stream information stored in the RAM 53 of the node 5.

ABSTRACT

PROBLEM TO BE SOLVED: To suppress generation of a pre-echo and a post-echo.

SOLUTION: A gain control position decision circuit 102 detects an attack part and a release part of an audio signal received from a terminal 100. An audible model application circuit 110 obtains a masking level based on an auditory psychological model of an input signal. A gain control variable decision circuit 111 decides a gain control variable selected adaptively according to the masking level. A gain control circuit 103 controls the gain of an audio signal inputted from the terminal 100 corresponding to the gain control variable.

ABSTRACT

PROBLEM TO BE SOLVED: To effectively prevent generation of pre-echoes and post-echoes and to enable effective coding that employs an auditory psychology model.

SOLUTION: Gain control circuits 103a to 103d detect the attacking and releasing parts of waveform signals and perform gain control on the waveform signals before the attacking parts and at the releasing parts by using gain controlled variables that are obtained adaptively according to the characteristics of the waveform signals. From a window circuit 108 for an auditory model to an auditory model employing circuit 110, a masking level based on an auditory psychology model is calculated from frequency components converted from the waveform signals, and a quantization accuracy determining circuit 111 determines the accuracy of quantization using the masking level. Window circuits 102a to 102d and converter circuits 104a to 104d convert the waveform signals into a plurality of frequency components, and quantization circuits 106a to 106d quantize the plurality of frequency components using the quantization accuracy.

ABSTRACT

PROBLEM TO BE SOLVED: To encode the multichannel signals with high efficiency.

SOLUTION: A mixer 102 produces the mixture processing data based on the audio data supplied through the input terminals 101a to 101e, and these processing data are supplied to the processing data extractors 103a to 103e and the encoders 105f and 105g respectively. The extractors 103a to 103e supply the data which are not reproduced by the mixture processing data to the encoders 105a to 105e, and the reproduction parameters of other data which are reproduced by the mixture processing data are supplied to a multiplexer 106. The reproduction parameters and the data which are encoded by the encoders 105a to 105g are turned into a bit stream by the multiplexer 106 and then outputted.

ABSTRACT

PROBLEM TO BE SOLVED: To encode the multichannel signals with high compression.

SOLUTION: A common processing analyzer 102 decides a combination of common frequency bands or channels based on the audio data supplied through the input terminals 101a to 101e. The common data extractors 103a to 103e extract the data on the common frequency bands, and other data are supplied to the encoders 105a to 105e. A common data producer 104 produces the common, data on the common frequency bands. The outputs of the extractors 103a to 103e and the output of the producer 104 are encoded by the encoders 105a to 105e. These encoded outputs are turned into a bit stream by a multiplexer 106 and outputted through an output terminal 107.

#### ABSTRACT

PURPOSE: To realize a high degree compression of a multi-channel signal by processing a digital signal of a part of channel as a common signal and applying coding processing to the signal.

CONSTITUTION: Audio data of each channel of a center C, a left L, a right R, a left surround SL and a right surround SR from input terminals 101a-101e are given to a common processing analyzer 102. An output of the analyzer 102 is given to extracted devices 103a-103e of corresponding channels and a common component is extracted from the original audio data for each channel and only the remaining components are fed to coders 105a-105e. An output of the analyzer 102 is fed also to a common data generator 104, in which common data of each channel are collected and rearranged and then the result is outputted. Each coder 105 gives common processing parameter information to a multiplexer 106 together with the coding data and the data are multiplexed into one-bit-stream.

#### ABSTRACT

PURPOSE: To attain higher sound quality by reducing the waste of bit assignment in the case of compression coding of plural channels thereby realizing efficient coding.

CONSTITUTION: A conversion circuit 401 converts the signal of one channel in input signals of plural channels into a frequency component, a signal component separate circuit 402 separates the component into a tone component and other noise component, and a tone component coding circuit 403 and a noise component coding circuit 404 encode the components respectively. A byte share circuit 310 decides the byte share with respect to the noise component of each channel based on the time change of the scale factor of each channel.

#### ABSTRACT

PURPOSE: To provide a high efficiency coding device which can apply the highly efficient compressing/coding processing to the data on plural channels including the band limited data on at least a single channel.

CONSTITUTION: Each of coding means c1-Cn compresses and codes the signals of plural channels including the band limited signal of at least a single channel by the same means. A re-coding means 100 applies the re-coding processing to the band limited signal of at least a single channel that is compressed and coded by the means Cn in order to get rid of the redundant information produced by the band limitation.

#### ABSTRACT

PURPOSE: To provide a device which can encode the multichannel audio data with high efficiency and with a high compression rate regardless of the degree of correlation of digital data among plural channels.

CONSTITUTION: The primary requantization means 225a-225h requantize the coded audio data and also generate the parameter information on these coding operations. A detector means 226 detects the common items based on the audio data that are requantized by the means 225a-225h and the parameter information. Then the secondary requantization means 227a-227h requantize at least some of those common items detected by the means 226.

#### ABSTRACT

PURPOSE: To eliminate the redundancy of a bit distribution amount at the time of compression encoding in multichannel and to make compression encoding/ decoding high definition.

CONSTITUTION: This device is constituted of an amplitude information detection circuit 200 detecting energy at every digital audio signals of plural channels, a bit distribution decision circuit 500 deciding the bit distribution amounts to respective channels based on the detection result, an encoder 400 compression encoding based on the bit distribution amount distributed at every channel according to the decision of the bit distribution amount and a formater 600 multiplexing a compression encoded signal at every channel, and the bit distribution amount decision circuit 500 is constituted so that the relation between the energy of the signal

and the bit distribution amount becomes a nonlinear characteristic where the bit distribution amount is increased according to the increase of the energy of the signal as a whole.

#### ABSTRACT

PURPOSE: To securely fix a mechanical deck in a cabinet in holding vibration resistance and to improve the maintainability of the audio equipment.

CONSTITUTION: The audio equipment possesses damper receiving parts 12d(sub 1)-12d(sub 3) disposed underneath the mechanical deck 6 provided with an optical pickup 10 and a turntable 8, etc., and formed with projections 12a(sub 1)-12a(sub 3) for fitting into fitting holes 7b(sub 1)-7b(sub 3) provided on an oil damper 7 in correspondence to its oil dampers 7(sub 1)-7(sub 3). Then, the equipment is equipped with a damper fitting plate 12 capable of holding the mechanical deck 6 via a damper mechanism consisting of the oil damper 7 and a coil spring S, and this damper fitting plate 12

is mounted and fixed on the bottom surface inside the cabinet 2.

Abstract: A new digital multi-channel audio format has been developed for motion pictures. This format has eight original channels and four back-up channels used for error concealment. These channels are divided into two digital soundtracks suitably so that one of these tracks can support the other. This error concealment scheme can work when one of tracks cannot reproduce at all.
